خلاصه مقاله:

Rabies is a fatal zoonotic disease that usually occurs via infected animal saliva. Two years after establishing the Pasteur Institute of Iran, the National Center for Reference & Research on Rabies, chaired by Dr. Mahdi Ghodsi, was formed to control and treat this disease in Iran. In ۱۹۵۵, Dr. Ghodsi, Dr. Balthazar, and Dr. Bahmanyar made a global transition in the rabies vaccination process. The rabies department was established in ۱۹۲۳. In ۱۹۷۶, it was selected to cooperate with the World Health Organization (WHO). Since ۲۰۱۳, according to ISO ۱۵۱۸۹, it was established as the rabies reference laboratory for the Ministry of Health and Medical Training and Veterinary Organization. For the ۱۰۰th year of establishing the National Center for Reference & Research on Rabies, this article reviews the history of the center and its activities, such as diagnostic tests of suspected samples of rabies, assessment of the effectiveness of rabies vaccine, and evaluation of rabies vaccine potency.

کلمات کلیدی:

Rabies, Research, diagnosis
