خلاصه مقاله:

In this study, the impacts of sanctions indicators, human capital, physical capital and energy consumption have been examined on the partial economic growth of Iran, using panel cointegration techniques with Fully Modified Ordinary Least Squares (FMOLS) approach, during the years 1976-2013. Regression results show that the trap variable of sanction and indicators of human capital (labor) have negative impact on the economic growth; where the indicators of physical capital (fixed capital formation) and total energy consumption have significantly positive impact

کلمات کلیدی:

sanction, economic growth, panel cointegration techniques
